RADOSLAW KRZYZAN

Delphi Developer

PROFILE

Well-organized, independent, and innovative software professional. Strong focus on high-quality code, emphasizing functionality, efficiency, and maintainability. Proven ability to deliver projects efficiently within agreed timelines and budgets. Experienced in team leadership, code reviews, and knowledge sharing. Highly organized and self-driven professional with an innovative mindset. Committed to delivering high-quality, efficient, and reliable code.

NATIONALITY: Polish

LANGUAGES SPOKEN: Polish, English

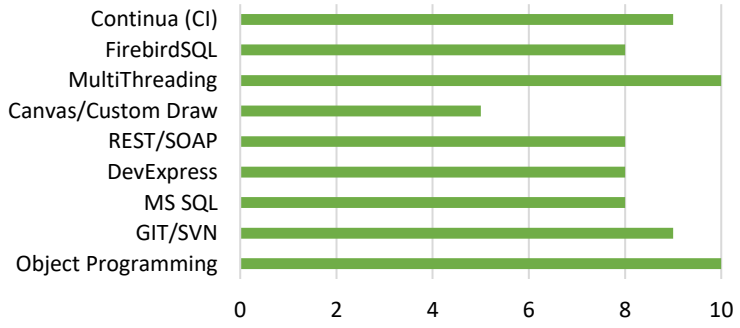
EXPERIENCE

What I am using on a daily basis in my work: generics, anonymous methods, anonymous threads, enumerators (TEnumerable), class helpers, interface, custom managed records, directives final/strict, class abstract, critical sections (SRW, TMREW, TMonitor), Eurekalog, FastReport, SVN and GIT.

Technology stack I am familiar with: mORMot, DMVC (I'm also **contributor** of this project), **REST**, SOAP, Mobile Solutions (Firemonkey), two way http communication based on SSE+Websocket+Long/Short Polling.

During my career I've migrated a dozen of 32 Bit apps (Delphi7) to the 64 bit Architecture considering the data types (int64, ansistring).

Meticulous and efficient software developer with a strong commitment to high code quality and clean, maintainable repositories. A programming enthusiast dedicated to continuous improvement and delivering reliable, well-structured software.



Yes, I know that leaving unused **uses** references is messy

Yes, I know that not taking care of placing **uses** references in the appropriate sections (**interface**, **implementation**) is a risk of circular reference and lack of implementation encapsulation

Yes, I know that leaving **hints** and **warnings** is messy

Yes, I know that using functions in the **where** section of SQL queries is a performance killer

Yes, I know that frequently used functions should include an **inline** clause

Yes, I know that using **const** guarantees better performance and no redundant allocation of variables

Yes, I know that putting off fixing a problem means the feature will never be finished

CAREER

POSITION: TEAM LEADER

VI.2011 – NOW, **PIRIOS (ASSECO GROUP), KRAKOW**
Managing an 8-person team consisting of programmers and testers creating the company's key software - the Contact Center application. Implementation of the automatic compilation mechanism Final Builder and Continua, which significantly simplified the delivery of complete application binaries for the testing and implementation departments. I designed the mechanisms ensuring greater stability of the client application, such as microservices based on REST + Websocket, automatic updates of client applications upon detection of changes, acceleration of data retrieval from the database by creating a data caching mechanism with a package of proprietary database components inheriting from TCustomDataset for communication with the cache. The application that I provided brought the company very large profits thanks to the implementation in the largest institutions and companies in Poland and continues to win new large projects.

POSITION: SENIOR DEVELOPER

X.2007 – VI.2011, **WIND TELECOM, KRAKOW**
Building client applications using DevExpress – especially cxGrid and dxRibbon. The challenge in this project was to split the monolithic application into modules, whose registration in the main application container resulted in enriching the program with new functionalities. This solution turned out to be very useful and works to this day in an unchanged form. The advantages of modularization of the program are: ease of adaptation to the needs of customers, the ability to diversify modules depending on the employee's competence, simple and self-versioned module designs, no need to replace the entire application in the event of an error in the selected module.

POSITION: DEVELOPER

X.2005 – VI.2007, **SOFTWAREMIND, KRAKOW**
Development of an advanced application for recording payments on payment terminals. My task was to implement new methods of settlement, integration with payment operators using the mechanism of injecting new functionalities based on interfaces.

POSITION: COMPANY OWNER

2001 - NOW, **KRAKOW**
Like every passionate programmer, I have developed numerous applications for personal use and commercial clients. These include software for the Cracow University of Technology, such as salary settlement systems, student payment management, as well as applications for car service businesses and medical clinics covering patient and test registration.

EDUCATION

1994—2001, **FACULTY OF COMPUTER SCIENCE, ELECTRONICS AND TELECOMMUNICATIONS, AGH, KRAKÓW**

SAMPLE SOURCE CODE

- Mechanism of safe generic lists based on MREW - uWindThreadList.pas
- The base class of the microservices mechanism - uService.Base.pas
- One of the elements of the three-layer data access mechanism and cache - uQueryData.pas
- Base class for the implementation of SMS providers - uService.SMSEngineBase.pas

INTERESTS

DOCKER (AND KUBERNETES)
– possibility of building redundant and vertically scalable server applications, also in the active-active model.

LINUX
– migration the applications to the Linux for placing them on Azure cloud solutions with Docker

MICROSERVICES
– creating and integrating services based on SOA architecture for efficient building of business applications divided into competences and application areas

PROJECT DETAILS

PROJECT CALL CENTER	
Duration	10 years
Database Engine	MS SQL, stored procedures
Delphi Version(s)	Delphi 7, Delphi Sydney
Responsibility	Main application architect, source code quality control, implementing the base modules or abstract layer for developers (interfaces and abstract methods). Frameworks used: mORMot, DMVC Framework, FastReports, REST, ORM, SSE+Longpolling, JWT. Multithreading, modularization, microservices, failover and scalability solutions.
Versioning Tool	SVN + GIT
PROJECT MOTOSCANNER	
Duration	10 years
Database Engine	Firebird SQL
Delphi Version(s)	Delphi Berlin
Responsibility	Main application architect, author and developer. Frameworks used: mORMot, multithreading, html page crawler, microservices, modularization
Versioning Tool	SVN
PROJECT FINANCIAL ACCOUNTING	
Duration	6 years
Database Engine	MS SQL
Delphi Version(s)	Delphi 7
Responsibility	Team member. Implementation of different methods of payments, different methods of financial documents. Integration with 3rd party payment gateways (SOAP), SMS Gateways (REST, COM Port/hardware).
Versioning Tool	SVN

I agree to the processing of personal data provided in this document for realizing the recruitment process pursuant to the Personal Data Protection Act of 10 May 2018 (Journal of Laws 2018, item 1000) and in agreement with Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation).
